

WATER COOLERS HAS A FUNNY TASTE

We recommended flushing your water cooler

Turn off water cooler & up plug

Remove bottle set

Empty out all water via taps

Remove spindle (inside tank) twist and pull up

Clean inside tank.

Place water cooler on sink, then unscrew bung plug via back of water cooler to drain the hot tank.

Once empty replace bung plug

Requirements: 4 litres white vinegar, funnel & bicarb

This will also remove build up calcium in tank

Place funnel in tank so when filling with vinegar will go into hot pot, fill until hot tank is full.

Remove funnel, then fill the cold tank with rest of vinegar until all calcium builds up is covered.

Best left covered, can use plastic cling wrap?

Leave for a few days (best during winter when not using water cooler as much.

Empty via taps and bung plug (place in shower easier)
Rinse machine with 2 x buckets water let run through the machine and empty via back bung plug

Also easier if use a pair of pliers to push down both taps at the same time.
Add bung plug back again

Mix a bucket of water with 1 cup of bicarb soda

Pour into the machine, leave a day or so
Drain via taps and bund plug
Rinse machine 2 x buckets water run

Wash and clean all bottle set parts
Put water cooler back together and fill
